

Лабораторна робота №2

Створення додатку бази даних, орієнтованого на взаємодію з СУБД PostgreSQL

КВ-94 Суховейко Олексій

Завдання

Загальне завдання роботи полягає у наступному:

Реалізувати функції перегляду, внесення, редагування та вилучення даних у таблицях бази даних, створених у лабораторній роботі №1, засобами консольного інтерфейсу.

Передбачити автоматичне пакетне генерування «рандомізованих» даних у базі.

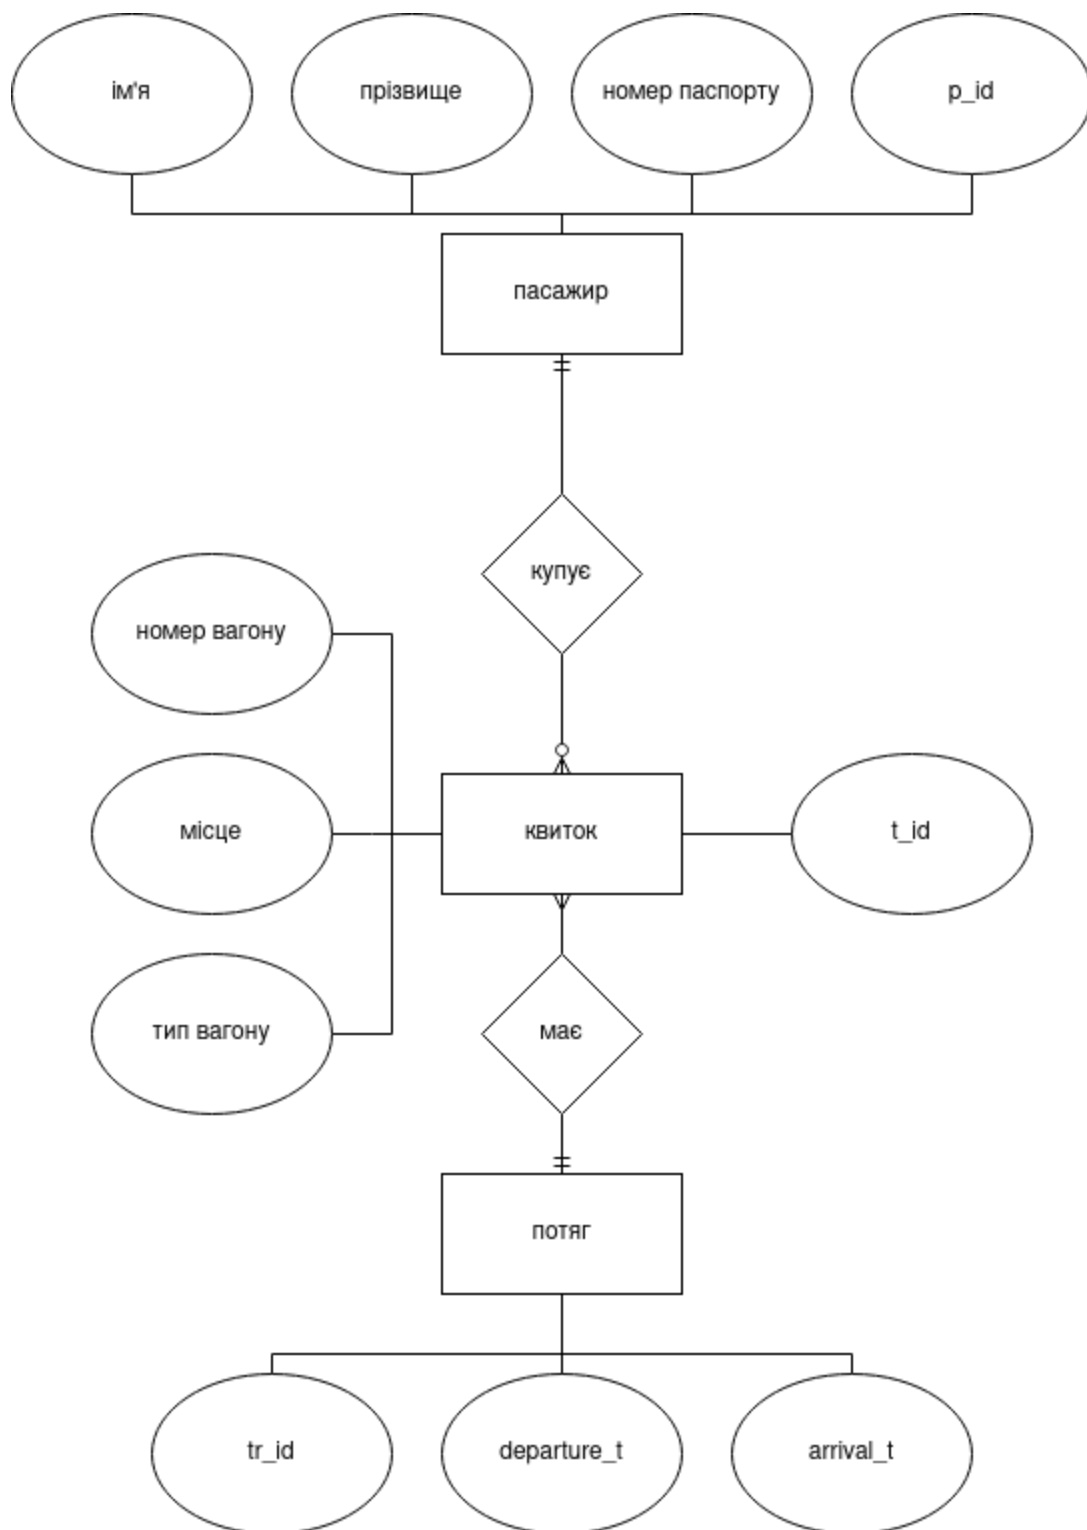

Забезпечити реалізацію пошуку за декількома атрибутами з двох та більше сутностей одночасно: для числових атрибутів – у рамках діапазону, для рядкових – як шаблон функції LIKE оператора SELECT SQL, для логічного типу – значення True/False, для дат – у рамках діапазону дат.

Програмний код виконати згідно шаблону MVC (модель-подання-контролер).

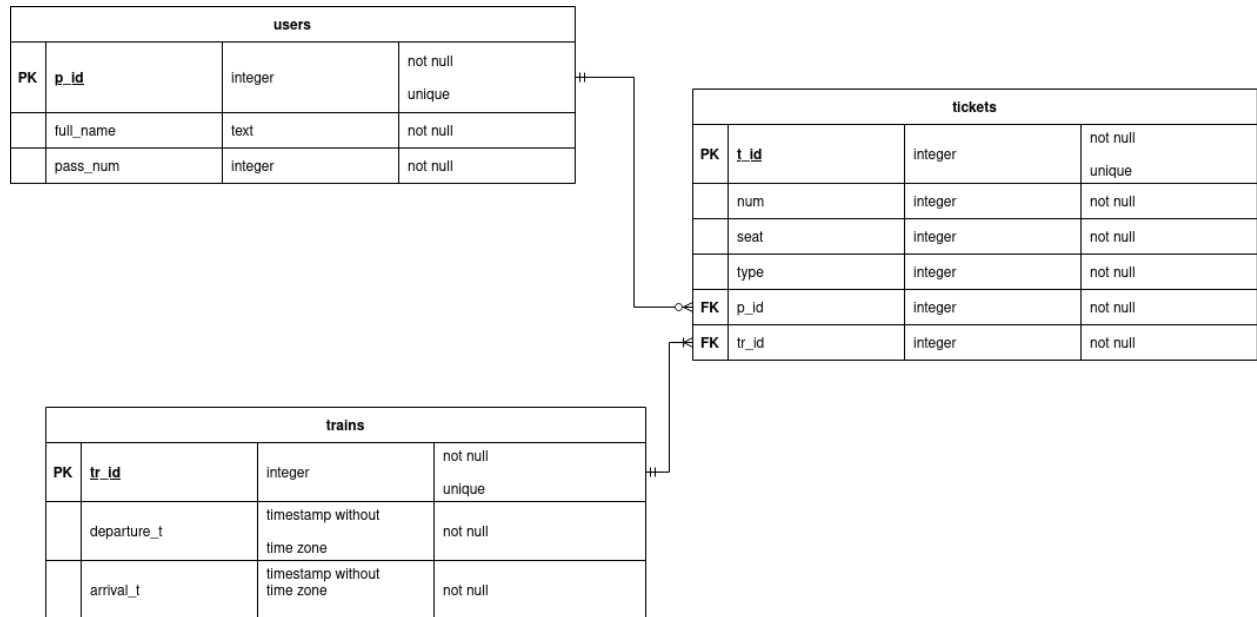

URL репозиторію з вихідним кодом

<https://github.com/meltdit/db-labs/tree/master/lab2>

Модель та структура бази даних

Модель "сутність-зв'язок" для обраної предметної області

Опис структури БД

| Таблиця | Атрибут | Опис атрибуту | Тип | Обмеження |
|---------|-------------|--------------------------|-----------------------------|--------------------|
| users | p_id | Унікальний ідентифікатор | integer | not null unique |
| | full_name | Повне ім'я користувача | text | not null |
| | pass_num | Номер паспорту | integer | not null |
| trains | tr_id | Унікальний ідентифікатор | integer | not null unique |
| | departure_t | Час вправлення | timestamp without time zone | not null |
| | arrival_t | Час прибуття | timestamp without time zone | not null |
| tickets | t_id | Унікальний ідентифікатор | integer | not null unique |
| | num | Номер вагону | integer | not null |
| | seat | Номер місця | integer | not null |

| | | | | |
|--|-------|--------------------------|---------|----------|
| | type | Тип вагону | text | not null |
| | p_id | Посилання на користувача | integer | not null |
| | tr_id | Почилання на потяг | integer | not null |

Мова програмування та бібліотеки

Робота виконана мовою програмування Python, для підключення до серверу Postgresql використано модуль psycopg2

Пункт 1

Вилучення

Виведення батьківської таблці

```

tr_id = 205
-----

t_id = 8
num = 8
seat = 8
type = first
p_id = 222

Короткий опис функцій модуля

showAllTables() - виводить всі таблиці
 showOneTable() -, виводить одну(обрану) таблицю
 delete() - вилучає обраний запис з обраної таблиці
 insert() - вставляє обраний запис в обрану таблиці
 update() - редагує атрибут у вибраному рядку

random() - введення випадкових рядків у таблиці users та trains

search() - пошук квитка з заданим ідентифікатором користувача(p_id) і типу квитка(type
